ABSTRACT

In a computer system having a client/server architecture, a

method is provided for generating reports based on information in

a telecommunications provisioning and inventorying database (42).

5   The method includes a server (50) presenting a user at a client

end (10) with a page (56) offering parameters for formulating a

report and scheduling the running and delivery of the report; the

user selecting parameters upon which the report is to be

formulated and scheduled; and the server (50) interfacing with

10   the database (42) to retrieve information designated by the

selected parameters and generating the report in accordance with

the selected parameters.
